Executive Summary

Overview

Stage 4 of the NASAwide Electronic Publishing System is the final phase of its implementation through the prototyping and gradual integration of each NASA center's electronic printing systems, desktop publishing systems, and technical report servers to be able to provide to NASA's engineers, researchers, scientists, and external users the widest practicable and appropriate

dissemination of information concerning its activities and the result thereof to their work stations. The inclusion of NASA Headquarters as a node essentially completes a totally distributed set of report servers for formal and nonformal publications as identified by Figure 11. Currently, no standard software package (single) exists across all NASA centers for either word processing or graphics, and manually pasting figures into documents is still prevalent. In addition to differences in software utilization, no standard platform across all NASA centers exists for producing the documents. Common sense dictates that it is neither appropriate nor cost-effective to define a standard set of software and compel all NASA's engineers, researchers, and scientists to conform. Rather, a common output format, such as Adobe PostScript, will be sought from among the set of software; the electronic document distribution system would only need to handle the single common output format.

The report is presented by an introduction, seven chapters, and six appendices; the Introduction describes the purpose, conceptual framework, functional description, and technical report server (TRS) of the Scientific and Technical Information (STI) Electronic Document Distribution (EDD)

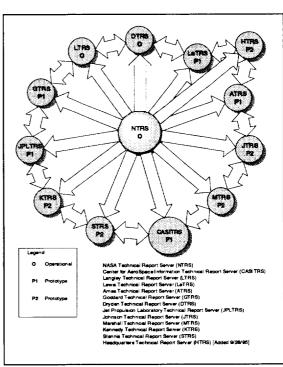

Figure 1. NASAwide Technical Report Servers.

project. Chapter 1 documents the results of the prototype STI EDD in actual operation, e.g., the electronic distribution of the source document to its printed output and the distributed on-line access to technical reports available at each NASA center. Metrics identifying the number of accesses on the NASA Technical Report Server (NTRS) and on the NASA Public Affairs Information Server (NPAIS) from the period July through December 1995 are displayed by Table 1 - 13 and Table 1 - 14, respectively. A number of abstracts, reports, and fact sheets are displayed by Table 1 - 15. A profile by subject division for abstracts available from the Center for AeroSpace Information Technical Report Server (CASITRS) are displayed by Table 1 - 16.

Although in a prototype stage, the actual demonstration of print on demand, which was achieved through the distributed production of the NASA Headquarters phone directory at each center, is documented. In the past, printing was accomplished by the NASA centers as shown by

¹Decision to exclude Headquarters as a node was made in December 1995.

the top band of Figure 2. The lower band of Figure 2 shows a fully operational electronic publishing process. The middle band of Figure 2 describes the current process. A second application included a file server that was designated the Public Affairs Information Series Server for the storage and retrieval of Public Affairs fact sheets and information summaries. Finally, a third application was added to document the pre- and post-processing steps involved during the preparation of a technical report to be published by a typical NASA researcher or engineer at a center.

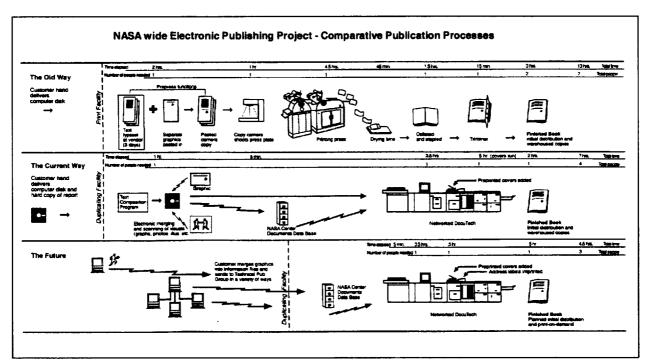

Figure 2. Comparative printing processes.

Figure 3 displays a conceptual macro view of the publication process from its conception to its storage, printing and on-line retrieval. Details are covered by Chapters 2, 3, and 4. Chapter 2 documents each NASA center's post processing publication process. Chapter 3 documents each NASA center's STI hardware, software, and communication configurations. Chapter 4 documents each NASA center's network topology. Chapter 5 documents lessons learned. Chapter 6 documents the STI standards and guidelines, and Chapter 7 documents STI EDD policy, practices, and procedures.

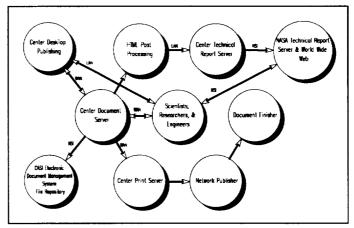

Figure 3. End-to-end functionality.

The appendices contain supporting information. Appendix A documents the STI EDD Project Plan jointly agreed to by all the participating NASA centers (Project Plan reflects status as

of November 1994; deliverables are reflected in Appendix C). Appendix B lists all the team members for the STI EDD project. Appendix C displays the progress of the STI EDD project from its start to its completion with its final delivery identified as this joint technical memorandum. Appendix D documents how a user accesses the on-line reports. Appendix E describes the creation of an hypertext markup language (HTML) file for a typical NASA fact sheet.

Recommendations

Conceptually, the prototype STI EDD project has demonstrated its potential value for the dissemination of scientific and technical work accomplished by NASA's engineers, scientists, and researchers. The statistical profiles, Tables 1 - 13 through 1 - 16 show the World Wide Web activity for the period July through December 1995. As of December 31, 1995, the prototype STI EDD was not fully integrated as a NASA Technical Report Server or a NASA Public Affairs Information Server; however, the prototype system has achieved its goal of devising a concept that is sound and feasible for the provision of scientific and technical information to the Agency, as well as to the public. In achieving a fully operational STI EDD, it is recommended that:

- 1. Headquarters Scientific and Technical Information Office continue to support the STI EDD full implementation across the Agency through the use of an Executive Notice or Policy Directive.
- 2. The STI EDD Committee be formally established with members from each NASA center, including the Center for AeroSpace Information, to coordinate and resolve Agencywide STI policy issues and interoperability for the exchange of scientific and technical information within the Agency and between agencies, as well as with commercial organizations and foreign countries.
- 3. Langley Research Center, who has been designated as the operations manager of the Center for AeroSpace Information, also lead the implementation of the STI EDD project, taking into consideration the initial creation of the technical publication to its availability on each center's technical report server or the availability for printed copies on designated networked high-speed production duplicators.
- 4. Langley Research Center continue its role as the system administrator for the NASA Technical Report Server.
- 5. Dryden Flight Research Center continue its role as the system administrator for the NASA Public Affairs Information Server.
- 6. Each NASA center take on the role of continual maintenance of the center's technical report server and public affairs information server, as well as its integration to the Agency's networked high-speed production duplicators.
- 7. Each NASA center participate in the integration of electronic document availability authorization (DAA) and report documentation page (RDP) as part of the publishing processes, i.e., creation to its archival and dissemination.

Strategic Enabling Technology

The NASAwide Electronic Publishing System consists of an enabling capability for each of the five Strategic Enterprises (Aeronautics, Mission to Planet Earth, Space Technology, Scientific Research, and Human Exploration/Development) to access, via the World Wide Web, its scientific and technical works and/or print-on-demand information (text, graphics, and images) within and across the five enterprises.

When fully implemented, this enabling capability will allow the NASA centers and Headquarters to perform wide-area, networked print-on-demand environments, as well as to provide a central source for retrieving NASAwide STI on line at each user's workstation. The prototype STI EDD project has established technical report servers at each NASA center. Additionally, with the exception of Dryden Flight Research Center, each NASA center will have a networked print-on-demand, high-speed production duplicator capable of printing quality print products.

Appendix B—Phasing Schedules

Each center participating in the prototype STI EDD project has a specific set of schedules for its implementation of the technical report server. A composite schedule reflecting the integration of each center's tasks are displayed by Figure B - 1 with supporting schedules displayed by Figures B - 2 to B - 9.

Figure B - 1 Prototype STI EDD Composite Figure B - 2 Goddard Space Flight Center Figure B - 3 Lewis Research Center Figure B - 4 Ames Research Center Figure B - 5 Langley Research Center Figure B - 6 Center for AeroSpace Information Jet Propulsion Laboratory Figure B - 7 Figure B - 8 Dryden Flight Research Center Figure B - 9 JSC/MSFC/KSC/SSC Centers and Hqts

Significant events leading up to each of the major deliverables are highlighted below:

1.	FAX to team, request for network topology at each participating center	12/16/94
2.	Coordination with JPL regarding inclusion in NTRS as JPLTRS	1/5 - 6/95
3.	Tech Focus Group VITS, presentation by Joint STI EDD Team - status	1/23/95
4.	FAX to team, request for input to joint TM	1/30/95
٦.	a. Draft 1 - Chapters 2, 3, and 4	2/28/95
	b. Draft 2 - Chapters 2, 3, 4, and 5	3/17/95
	c. Draft 3 - Chapters 2, 3, 4, 5, and 6	4/7/95
	d. Final Working Draft - Introduction plus all chapters	5/1/95
	e. Joint Working Session at LeRC plus use of VITS	5/15/95
5.	Coordination with DFRC regarding inclusion in prototype STI EDD project	1/30/95
6.	Coordination with JSC regarding inclusion in prototype STI EDD project	2/3/95
7.	Coordination with KSC regarding inclusion in prototype STI EDD project	2/3/95
8.	Coordination with MSFC regarding inclusion in prototype STI EDD project	2/6/95
9.	Coordination with SSC regarding inclusion in prototype STI EDD project	2/6/95
10.	Budget memo sent to Budget Office for Code M STI EDD participation	2/13/95
11.	Initiate file transfer testing between STI EDD file server sites	2/8/95
12.	Fax joint plan addendum to Code M centers for their review	2/14/95
13.	Initiate EDD application - Headquarters Telephone Directory	2/28/95
14	Initiate EDD application - Public Affairs Fact Sheets	3/17/95
15.	Coordinate Implementation Hqtr's Telephone Directory - Code JOB-1 & JT	5/9/95
16.	Presentation to ITMSC Standards and Architecture Sub-Board	6/14/95
17.	STI EDD VITS - Center status	6/19/95
18.	Coordination with LeRC/MSFC/JSC - NPAIS	6/27-29/95
19.	Presentation to Code U, Life & Microgravity Sciences & Applications	7/12/95
20.	Coordination with Code JOB-1 & JT - GPO/Covers/Elec Interface Issues	8/21/95
21.	STI EDD Workshop at LeRC	8/22-8/23/95

Appendix C—Accessing NASA Public Affairs Information Server (NPAIS)

Using Netscape for Windows

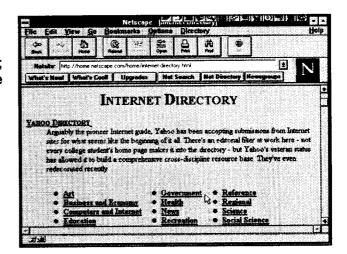

Instructions for using Netscape for Windows are provided below. The same-step by-step instructions can be used for using Netscape for the Macintosh.

Double click on the Netscape Step 1 icon in Program Manager. If you have the Netscape Home Page as your default, double click on Net Directory; this will

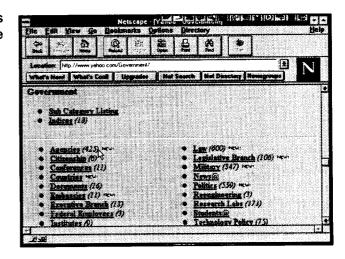

for Step 2.

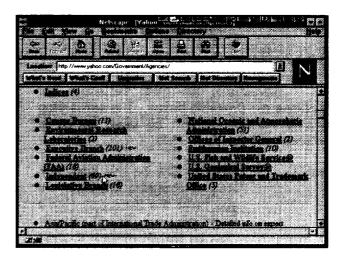

Double click on Government; Step 2 this will give you the next Home Page listing for Step 3.

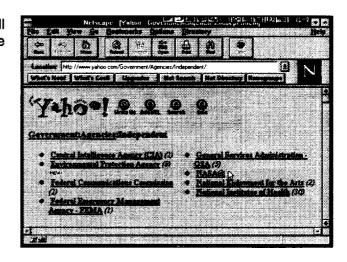

Double click on Agencies; this Step 3 will give you the next Home Page listing for Step 4.

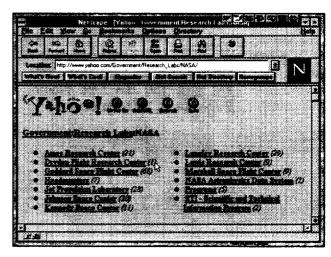

Step 4 Scroll down the Home Page and double click on **Independent**; this will give you the next Home Page listing for Step 5.

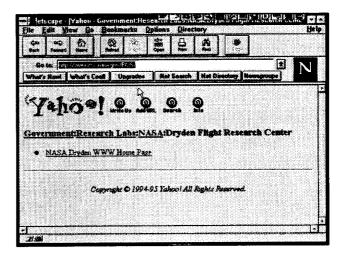

Step 5 Double click on **NASA**; this will give you the next Home Page listing for Step 6.

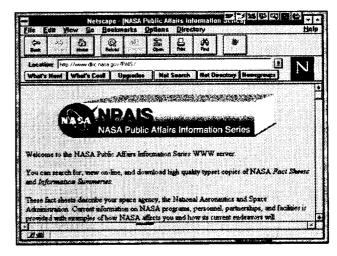

Step 6 Double click on **Dryden Flight Research Center**; this will give you the next Home Page for Step 7.

Step 7 To access the NPAIS Home Page, use the following URL: http://www.dfrc.nasa.gov/PAIS; this will give the next Home Page, go to Step 8.

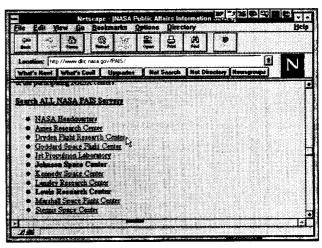

Step 8 Scroll down the Home Page till you can access the **Dryden**Flight Research Center; go to Step 9.

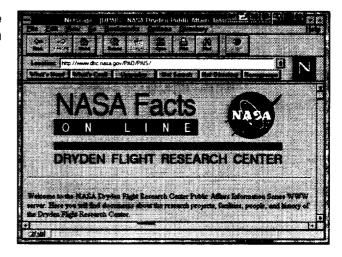

Step 9 Double click on **Dryden Flight Research Center** to access

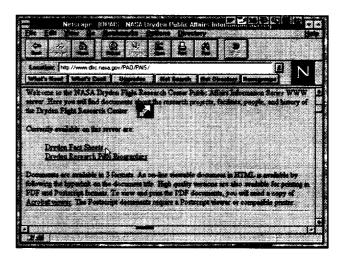

Home Page for DPAIS On Line
Fact Sheets; go to Step 10.

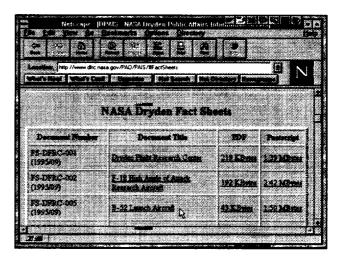

Step 10 Scroll down the Home Page listing until you reach **Dryden Fact Sheets**; go to Step 11.

Step 11 Double click on **Dryden Fact Sheets** and go to Step 12.

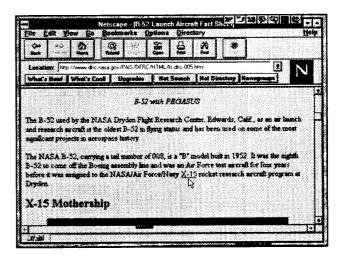

Step 12 Select the fact sheet you want by double clicking on **B-52**Launch Aircraft; go to Step 13.

Step 13 Scroll down the Home Page until you see the specific key word you desire to do further research on; go to Step 14.

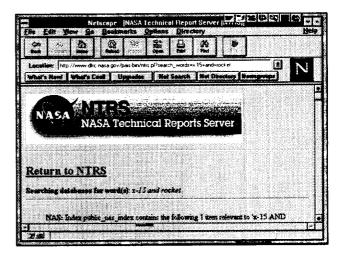

Step 14 Double click on the key word X15 to enable the execution of keyword searching against the NASA Technical Report Server; go to Step 14.

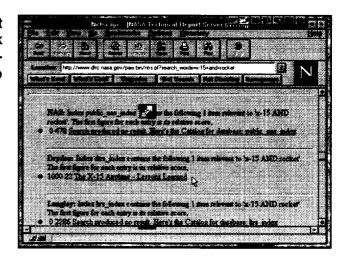

Step 15

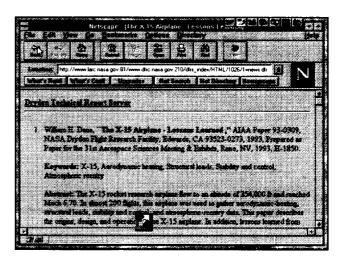

Scroll down the Home Page to view the specific title pages that the key word found. The NTRS will list all hits by xTRSs currently available; go to Step 16.

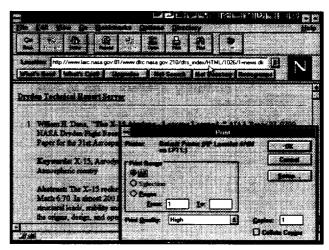

Step 16 To obtain the abstract of the list of titles available, double click on The X-15 Airplane - Lessons Learned; go to Step 17.

Step 17 At this step, you will have the abstract which you can now print out on your local printer by double clicking on the Netscape Print Button; go to Step 18.

Step 18 Double click **ok** to print the abstract on your local printer. Results of the printed abstract are shown by Step 19.

Step 19 Printed abstract from the Dryden Technical Report Server (DTRS).

Dryden Technical Report Server

| William H. Dana, "The X-15 Airplane - Lessons Learned," AIAA Paper 93 0109, NASA Dryden Flight Research Facility, Edwards, CA 93523-0273, 1993, Prepared as Paper for the 31st Aerospace Sciences Meeting & Exhibits, Reno, NV, 1993, H-1850
| Keywords: X-15, Aerodynamic heating, Structural loads: Stability and control. Atmospheric reentry
| Abstract: The X-15 resket research airplane flew to an altitude of 354,000 ft and reached Mach A70 in administ 200 flights, this airplane was used to gather aerodynamic-heating, arractival loads, stability and control, and atmospheric-recentry data. This paper describes the origins, design, and operation of the X-15 airplane. In addition, lesson the latter drom the X-15 airplane in addition, lesson the latter drom the X-15 airplane in addition, lesson the latter form the X-15 airplane in the agreement applicable to designing and testing the National AeroSpace Plane are discussed.

At step 12, you have the functionality to print the Document Title as shown by Step 19, or to print the file in PDF or PostScript, if you have available on your PC the necessary software. Note that the size of the PDF and PostScript files are shown.

Appendix D—Creating an HTML File and Setting up an xTRS

Introduction

This appendix was created from exerpts taken from an instruction course on the "Authoring HTML Documents/Home Page," taught by Ms. Robin Dumas, Information Systems Services, Section 392, Jet Propulsion Laboratory. Requests for her instruction manual may be directed to her on e-mail at Robin.C.Dumas@jpl.nasa.gov. The following text will provide the process used in creating an html file using a Public Affairs Office Fact Sheet prepared by DFRC as an example. Before an html file can be created, it must first be converted from the word processing file format to a text file format and then html tagged. Graphics are converted to gif format. In the Public Affairs Office environment, the word processors used are Personal Computers and MacIntosh machines. Conversions are displayed by Table D - 1. Table D - 2 provides a list of HTML tags and their definition. Following Figure D - 4 are instructions on setting up an xTRS.

Table D - 1. Conversion to Text

Software	Personal Computer	MacIntosh		
PageMaker		Export text only, e.g., abc.txt		
Microsoft Word		Save as text only, e.g., abc.txt		
WordPerfect	Save as ASCI (DOS) text only, e.g., abc.txt			
Graphics	Save as abc.gif file	Save as abc.gif file		

Table D - 2 HTML Tags

HTML Tag	What it means		
<html> & </html>	Indicates that file is an html file, where / represents ending point		
<title> & </title>	Indicates text that will be in browser window box		
<body> & </body>	Indicates main body of file		
<h#> & </h#>	Indicates level of heading where # represents levels 1, 2, 3, 4, 5, or 6		
<	Indicates paragraph break		
	Indicates line break (no extra space)		
<hr/>	Indicates horizontal rule		
 & 	Indicates bold text		
<i> & </i>	Indicates italic text		
<tt> & </tt>	Indicates fixed width text		
<pre> & </pre>	Indicates fixed width text in which tabs and line breaks are displayed in the same locations as in the source html file		
<blookquote> & </blookquote>	Indicates indented text separated from surrounding text		
<address> & </address>	Indicates address text at end of file		

HTML Tag	What it means			
 	Ordered (numbered) list			
	Unnumbered list			
<	Indicates line item of list			
<dl> & </dl>	Indicates definition list			
<dt></dt>	Indicates word being defined			
<dd></dd>	Indicates text of definition			
	Indicates in-line image file where filename is name of file Must be a .gif or .xbm file format Keep under 30Kb, since larger files take longer to display			
link anchor	Indicates link to another file (.html, .tiff, .jpeg, .au, etc) Where filename = name of file being linked, and Link anchor = text indicating hypertext link Filename must include pathname Use for larger image files			
Relative pathname	Used when linking related documents which will remain in one directory or on one file server, e.g., "contents.htm"			
Absolute pathname	Used when linking unrelated files, or linking to another Home Page or server Must include entire pathname - scheme://host.domain/path/filename where scheme = type of link, host = server, domain = where the server is known, path = directories, and filename = name of file e.g., "http://techinfo.jpl.nasa.gov/sec644/authoring_html/toc.html"			

Source Document

The first couple of paragraphs of a Fact Sheet have been extracted and are displayed below: HTML tagging is shown by the next section.

F-8 Digital Fly-By-Wire Fact Sheet

The Digital Fly-By-Wire (DFBW) concept utilizes an electronic flight control system coupled with a digital computer to replace conventional mechanical flight controls.

The first test of a DFBW system in an aircraft was in 1972 on a modified F-8 Crusader at the Dryden Flight Research Facility, Edwards, Calif. It was the forerunner of the fly-by-wire flight control systems now used on the space shuttles and on today's military and civil aircraft to make them safer, more maneuverable, and more efficient.

Background

In the first few decades of flight, pilots controlled aircraft through direct force -- moving control sticks and rudder pedals linked to cables and pushrods that pivoted control surfaces on the wings and tails.

HTML Tagged Document and MOSAIC Display

Figures D - 1 to D - 3 displays a fully tagged html file which includes the hyperlink to a gif file.

Removal of all tags would represent the source document in ASCI format. The ASCI format is created by saving the source document as an ASCI file from whatever DeskTop word processing

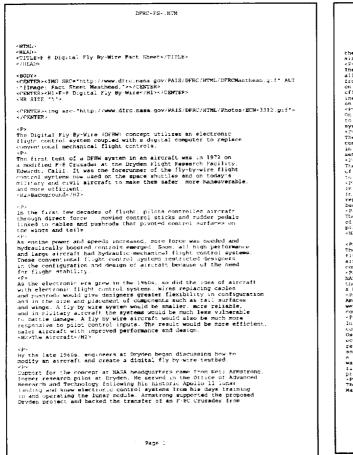

Figure D - 1. HTML coded file.

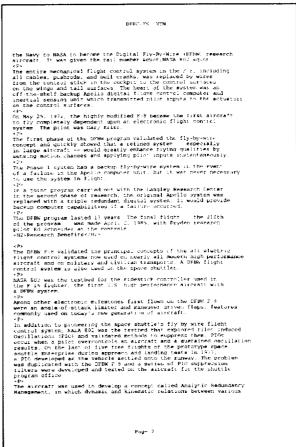

Figure D - 2. HTML coded file.

software was used to create the fact sheet. Explanation and use of the tags are contained in Table D - 2. Figure D - 4 displays the first page of the Fact Sheet by MOSAIC on a PC. By comparing the source document with Figure D - 1, the creation of Figure D - 4 can be accomplished. Specifically, the steps are as follows:

F-8 Digital Fly-By-Wire Fact Sheet gives:

dissimilar sensors and measurements are used to detect and isolate sensor failures.

In another series of successful tests, a software back-up system (Resident Backup System) was demonstrated as a means to survive common software faults which could cause all three channels to fail this system so book subsequently used on many experimental and production aircraft systems.

The Dryden project also worked with the British Royal Aircraft Satabinshment using the DMBM F-8 to produce ground-based software to use when researchers are investigating fight romatols in high environments. During contingencies, pilots can disentage the ground control software and switch to backup on-board controls.

DTBM research carried out with NASA 802 at Dryden is now considered one of the most significant and swiccessful aeronautical programs in NASA history.

Setting Up xTRS (Technical Report Server)

This section of the Joint Technical Memorandum was written by Mr. Michael Nelson, LaRC, and can be retrieved at

"http://techreports.larc.nasa.gov/ntrs/xtrs.html. The HTML ASCII file follows:

<htmi>

<head>

<title>How Do I Set Up My Own Technical Report

Server?</title>

</head>

<body>

<h1>

How Do I Set Up My Own Technical Report Server?

</h1>

<h2>Two Things are needed:</h2>

>

<dd> 1. a WAIS URL that points to your abstract database

<dd> 2. a URL that points to your xTRS home page

>

<hr>

Notes:

<hr>

 You will need to install some version of WAIS on your machine. The best version of WAIS is freeWAIS-sf:

>

<A> http://ls6-www.informatik.uni-dortmund.de/freeWAIS-sf/

 Pfeifer, Ulrich; Fuhr, Norbert; Huynh, Tung: "Searching Structured Documents with the Enhanced Retrieval Functionality of freeWAIS-sf and SFgate", Proceedings of the Third International World Wide Web Conference, Darmstadt, Germany, April 10-14, 1995, pp. 1027-1036. (

http://www.igd.fhg.de/www/www95/papers/47/fwsf/fwsf.html)

freeWAIS-sf has a very powerful and flexible indexing mechanism. Its use is covered in Appendix A.

>

```
the following SunOS binaries: (the source has been lost ;-)
<LI>
<href="http://www.larc.nasa.gov/ntrs/waisserver">http://www.larc.nasa.gov/ntrs/waisserver</A>
href="http://www.larc.nasa.gov/ntrs/waisindex">http://www.larc.nasa.gov/ntrs/waisindex</A>
If you use this version of <tt>waisindex</tt>, use:
>
<img src="http://www.larc.nasa.gov/images/top_divider.xbm">
<code>
    waisindex -pos -export -t html -d xtrs_index $YEARS/*.html
</code>
<D>
<img src="http://www.larc.nasa.gov/images/bottom_divider.xbm">
>
>
Put your "citations + abstracts" in <b>refer</b> format.
>
ul>
refer format has been around for a while. On SunOS systems, you can <tt>man addbib</tt> for more information.
An HTML version of the tag explanations is available at: <a</li>
href="http://www.cs.indiana.edu/ucstri/bib.format">http://www.cs.indiana.edu/ucstri/bib.format</a>
Sample refer citations can be viewed at: <a</li>
href="http://techreports.larc.nasa.gov/ltrs/examples.html">http://techreports.larc.nasa.gov/ltrs/examples.html</a>
A compressed tar file of all LTRS contents in refer format can be viewed at: <a</li>
href="ftp://techreports.larc.nasa.gov/.waters/waters.tar.Z">ftp://techreports.larc.nasa.gov/.waters/waters.tar.Z</a>. This
is provided for reference only -- you do not have to do anything with these contents.
There is nothing magic about refer; you can use some other format if you wish. You'll be on your own though for
adapting / creating filters to process other formats.
>
<LI> There is a Perl program to process the refer citations. This program (and its library) have binary characters in them
and they must saved to disk prior to viewing them. In other words, you must save the links without actually viewing them.
A copy-n-paste will not work!!!
>
<a href="http://www.larc.nasa.gov/ntrs/bib">http://www.larc.nasa.gov/ntrs/bib</a>
<a href="http://www.larc.nasa.gov/ntrs/accent.pl">http://www.larc.nasa.gov/ntrs/accent.pl</a>
<tl>accent.pl</tl> is a library file for <tt>bib</tt> -- it must be visible to <tt>bib</tt>. Edit the following lines of
<tt>bib</tt> appropriately:
>
<imq src="http://www.larc.nasa.gov/images/top_divider.xbm">
<code>
unshift(@INC,"/ump/csb/home/mln/ltrs/bin"); <br>
require("accent.pl"); 
</code>
<img src="http://www.larc.nasa.gov/images/bottom_divider.xbm">
>
```

If you do not wish to install freeWAIS-sf, and already have another version of WAIS installed at your site, I can offer

```
>

/tt> is very easy to use. Here are some sample invocations:
>
<LI> To take <b>many</b> refer files, and convert them to <b>many</b> .refer.html files to be used for
<tt>waisindex</tt>
<img src="http://www.larc.nasa.gov/images/top_divider.xbm">
<code>
        bib -ha -hk *.refer
</code>
>
<img src="http://www.larc.nasa.gov/images/bottom_divider.xbm">
To take <b>many</b> refer files and convert them to a <b>single</b> .html file <i>with abstracts</i> for browsing
>
<img src="http://www.larc.nasa.gov/images/top_divider.xbm">
    bib -ha *.refer >> all-years-abs.html
</code>
>
<img src="http://www.larc.nasa.gov/images/bottom_divider.xbm">
To take <b>many</b> refer files and convert them to a <b>single</b> .html file <i>without abstracts (i.e. just
citations) </i>
<img src="http://www.larc.nasa.gov/images/top_divider.xbm">
<code>
    bib -h *.refer >> all-years-cit.html
</code>
<D>
<img src="http://www.larc.nasa.gov/images/bottom_divider.xbm">
>
The source code for NTRS is available at: <a</li>
href="http://www.larc.nasa.gov/ntrs/ntrs.pl">http://www.larc.nasa.gov/ntrs/ntrs.pl</a> <b>This is for your knowledge
only</b>; you do not have to install NTRS or use anything from this script to set up your technical report server.
>
A csh script that I used to maintain LTRS is in <A href="#appb">Appendix B</a>. It should help you automate
maintainance for your site.
>
Your technical report server should support, at a minimum, 2 functionalities:
<dd> 1. Searching
<dd> 2. Browsing
>
```

Searching is the trickiest to implement, but is the part used most significantly in NTRS.

```
The following may be of use to your site as well:
>
ul>
user feedback form: <A</li>
href="http://techreports.larc.nasa.gov/ntrs/feedback.pl">http://techreports.larc.nasa.gov/ntrs/feedback.pl</a>
abstract entry form: <a
herf="http://techreports.larc.nasa.gov/ntrs/conrtrib.pl">http://techreports.larc.nasa.gov/ntrs/conrtrib.pl</A>
No promise is made about their quality, code aesthetics, or anything else. ;-)
>
<LI> The e-mail list for NTRS feedback and notices is:
<tt>ntrs-admin@techreports.larc.nasa.gov</tt>
Please e-mail <tt>m.l.nelson@larc.nasa.gov</tt> if you want on or off this list.
The current members of the list are at: <a
href="http://techreports.larc.nasa.gov/ntrs/ntrs-admin.txt">http://techreports.larc.nasa.gov/ntrs/ntrs-admin.txt</a>
>
The following services are being worked on:
<D>
<LI> Parallel searching in NTRS (Ming Maa, Michael Nelson)
Gateways with non-WAIS databases (Ming Maa, Michael Nelson, Jeff Robinson, Alberto Accomazzi)
Fielded searches (not too much interest in this of late)
NTRS acting as a proxy to resolve the long URL / firewall problem (Ming Maa, Michael Nelson)
<D>
>
<hr>
>
<a name="appa"></a>
<h2>Appendix A: Using freeWAIS-sf</h2>
freeWAIS-sf does not support the <tt>waisindex ... -t html ... </tt> construct. Instead, it has the concept of a "format" file,
where the user builds the description of how the files should be indexed. It is useful for all types of files, not just HTML
files. This format file is also how fielded searches would be added if you are ready to take that step.
>
For the example given below, it assumes that your HTML files are following the correct HTML 2.0 specifications and
have the following tags (white space and case are not important):
>
<hr>
&ItHTML&gt
&ItHEAD&gt
&ltTITLE&gt ... &ltTITLE&gt
&lt/HEAD&gt
```

<BODY>

```
stuff....
&lt/BODY&at
&lt/HTML&gt
<hr>
>
<tt>waisindex</tt> would then be invoked like:
>
<img src="http://www.larc.nasa.gov/images/top_divider.xbm">
    waisindex -pos -export -T HTML -t fields -d xtrs_index $YEARS/*.html
</code>
>
<img src="http://www.larc.nasa.gov/images/bottom_divider.xbm">
This assumes the existance of a file <tt>xtrs_index.fmt</tt>. This format file would look something like:
>
<hr>
&ltrecord-end&gt /(&lt.BODY&gtl&lt.HTML&gt)/
    &ltlayout&gt
    &Itheadline&gt /&ItTITLE&gt/ /&ItVTITLE&gt/ 80 /&ItTITLE&gt *./
    &Itend&gt
    &ltfield&gt /&ltHTML&gt/
    stemming TEXT GLOBAL
    &Itend&gt /&It.BODY&gt/
<hr>
>
You will need a separate format (.fmt) file for each database you index.
This file tells <tt>waisindex</tt> to use the string between the &tTITLE&gt tags as the string for the headline. The
headline is the list of "titles" that one sees immediately upon doing a WAIS search. The "80" in this line indicates
to only use the first 80 characters. The format file also tells <tt> waisindex</tt> to index everything between the
&ttHTML&gt tag and either one of the tags: &lt/HTML&gt or &lt/BODY&gt.
>
<hr>
<hr>
<hr>
>
<a name="appb"></a>

This evaluation report contains an introduction, seven chapters, and five appendices. The Introduction describes the purpose, conceptual frame3work, functional description, and technical report server of the STI Electronic Document Distribution (EDD) project. Chapter 1 documents the results of the prototype STI EDD in actual operation. Chapter 2 documents each NASA center's post processing publication processes. Chapter 3 documents cach center's STI software, hardware, and communications configurations. Chapter 7 documents STI EDD policy, practices, and procedures. The appendices, which are contained in Part II of this document, consist of A) STI EDD Project Plan, B) Team members, C) Phasing Schedules, D) Accessing On-line Reports, and E) Creating an HTML File and Setting Up an xTRS. In summary, Stage 4 of the NASAwide Electronic Publishing System is the final phase of its implementation through the prototyping and gradual integration of each NASA center's electronic printing systems, desktop publishing systems, and technical report servers to be able to provide to NASA's engineers, researchers, scientists, and external users the widest practicable and appropriate dissemination of information concerning its activities and the result thereof to their work stations. 14.
